Entity-Relationship Model – Part 4

<https://powcoder.com>

From ER to Relations

Add WeChat powcoder

Recap - Data Modeling

- ER design is **subjective**:
 - There are many ways to model a given scenario.
 - Analyzing alternative schemas is important.
- Constraints play an important role in designing a good database. But,
 - Not all constraints can be expressed in the ER model;
 - Not all constraints in the ER model can be translated.
- A good database design requires to further refining a relational database schema obtained through translating an ER diagram.

An ER Diagram - The Company Database

Assignment Project Exam Help

ER-to-Relations Algorithm

Assignment Project Exam Help

• 7-step algorithm to convert the basic ER model into relations and more steps for the EER model.

Step 1: Mapping of Regular Entity Types

Step 2: Mapping of Weak Entity Types

Step 3: Mapping of Binary 1:1 Relationship Types

- Foreign key approach
- Merged relation approach
- Cross-reference approach

Step 4: Mapping of Binary 1:N Relationship Types

Step 5: Mapping of Binary M:N Relationship Types

Step 6: Mapping of Multi-valued Attributes

Step 7: Mapping of N-ary Relationship Types

Step 8: Mapping of Superclass/Subclass

<https://powcoder.com>
Add WeChat powcoder

Step 1: Regular Entity types

For each regular entity type E , create a relation schema with the attributes of E (ignore multi-valued attributes until Step 6), where

- **PK:** the key attributes of E

Add WeChat powcoder

- DEPARTMENT(Name, Address) with PK: {Name}
- PROJECT(Pnumber, Pname, Location) with PK: {Pnumber}
- **Note:** These are not necessarily the final relation schemas of DEPARTMENT and PROJECT.

Step 1: Regular Entity types

- How can we translate the regular entity type EMPLOYEE?

Add WeChat powcoder

- EMPLOYEE(SSN, Name, Salary) with PK: {SSN}
- Note:**
 - This is not the final relation schema of EMPLOYEE (will be further extended later on).
 - Multi-valued attributes are ignored until Step 6.

Step 2: Weak Entity Types

For each weak entity type E_w , create a relation schema with the attributes of E_w , plus the PK of its identifying entity type, where

- **PK:** the partial key attributes of E_w plus the PK of its identifying entity type
- **FK:** references the PK of its identifying entity type

<https://powcoder.com>

- CHILD(SSN, Cname, Age) with
 PK: {SSN, Cname}
 FK: [SSN] \subseteq EMPLOYEE[SSN]

Step 3: Binary 1:1 Relationship Types - (Foreign key approach)

For a 1:1 relationship type R with one total participation, extend the relation schema of the total-side entity type by the attributes of R and the PK of the partial-side entity type, where

- **PK:** still the PK of the total-side entity type
- **FK:** references the PK of the partial-side entity type

- DEPARTMENT(Name, Address, Mgr_SSN, Start_date) with
PK: {Name}
FK: [Mgr_SSN] \subseteq EMPLOYEE[SSN].

Step 3: Binary 1:1 Relationship Types - (Merged relation approach)

Assignment Project Exam Help

- How can we translate the following kind of 1:1 relationship type?

Add WeChat powcoder

- If participation on both sides is total, we may merge the relation schemas of both entity types and the attributes of the relationship type into a single relation.
- EMPLOYEE-DEP(SSN, Name, Salary, Start_date, Dname, Address) with PK: {SSN} or {Dname}

Step 3: Binary 1:1 Relationship Types - (Cross-reference approach)

Assignment Project Exam Help

- How can we translate the following kind of 1:1 relationship type?

Add WeChat powcoder

- If both sides are partial, we may create a relation schema which cross-references the PKs of the relation schemas of the two entity types.
- MANAGES(SSN, Dname, Start_date) with
PK: {SSN} or {Dname}
FKs: [SSN] \subseteq EMPLOYEE[SSN] and [Dname] \subseteq DEPARTMENT[Name]

Step 4: Binary 1:N Relationship Types

- For each 1:N relationship type R , extend the relation schema of the N-side entity type by the attributes of R and the PK of the 1-side entity type, where

- PK:** still the PK of the N-side entity type
- FK:** references the PK of the 1-side entity type

<https://powcoder.com>

- EMPLOYEE(SSN, Name, Salary, Dname) with
PK: {SSN}
FK: [Dname] \subseteq DEPARTMENT[Name]

Step 4: Binary 1:N Relationship Types

- How can we translate the 1:N relationship type SUPERVISE?

- EMPLOYEE(SSN, Name, Salary, Dname, Super_SSN) with
PK: {SSN}
FK: [Dname] \subseteq DEPARTMENT[Name] and [Super_SSN] \subseteq EMPLOYEE[SSN]

Step 5: Binary M:N Relationship Types

Assignment Project Exam Help

- For each M:N relationship type R , create a relation schema with the attributes of R plus the PKs of the participating entity types, where
 - PK:** the combination of the PKs of the participating entity types
 - FKs:** references the PKs of the participating entity types

<https://powcoder.com>

Add WeChat powcoder

- WORKS_ON(SSN, Pnumber, Hours) with
 - PK: {SSN, Pnumber}
 - FKs: [SSN] \subseteq EMPLOYEE[SSN] and [Pnumber] \subseteq PROJECT[Pnumber]

Step 6: Multi-valued Attributes

- For each multi-valued attribute A , create a relation schema with an attribute corresponding to A plus the PK of the entity/relationship type that has A as an attribute, where

- PK:** the combination of A and the PK of the entity/relationship type that has A
- FK:** references the FK of the entity/relationship type that has A

- EMPLOYEE_ADDRESS(SSN, Address) with
PK: {SSN, Address}
FK: [SSN] \subseteq EMPLOYEE[SSN]

Step 7: N-ary Relationship Types

- For each N-ary relationship type R , create a relation schema with the attributes of R , plus the PKs of the participating entity types, where
 - PK:** the combination of the PKs of the participating entity types
 - FKs:** references the PKs of the participating entity types

- MENTORS(SSN, Sname, Pnumber, From, To) with
 - PK: {SSN, Sname, Pnumber}
 - FK: [SSN] \subseteq EMPLOYEE[SSN], [Sname] \subseteq INTERN_STUDENT[Sname], and [Pnumber] \subseteq PROJECT[Pnumber]

Step 8: Superclass and Subclass

Assignment Project Exam Help

- For each superclass, **create a relation schema** with its attributes.
- For each subclass, **create a relation schema** with its attributes plus the key attributes of its superclass.

PK: the PK of the superclass
FK: references the FK of the superclass

<https://powcoder.com>

- EMPLOYEE(...) (as done before)

- SECRETARY(SSN, Level),
TECHNICIAN(SSN, Grade),
ENGINEER(SSN, Type),
which all have

PK: {SSN}

FK: [SSN] \subseteq EMPLOYEE[SSN]

ER-to-Relations Algorithm (Recall)

Assignment Project Exam Help

- The algorithm first convert the basic ER model into relations and then convert superclass/subclass from the EER model into relations.

Step 1: Mapping of Regular Entity Types

Step 2: Mapping of Weak Entity Types

Step 3: Mapping of Binary 1:1 Relationship Types

- Foreign key approach
- Merged relation approach
- Cross-reference approach

Step 4: Mapping of Binary 1:N Relationship Types

Step 5: Mapping of Binary M:N Relationship Types

Step 6: Mapping of Multi-valued Attributes

Step 7: Mapping of N-ary Relationship Types

Step 8: Mapping of Superclass/Subclass
