Enhanced Entity-Relationship (EER) Model

Assignment Project Exam Help

- The basic modelling concepts are only sufficient for some database applications.
- To reflect data properties and constraints more precisely, a number of enhanced ER models (EERs) were proposed.
- Each EER model includes all the basic modeling concepts of the ER model we discussed before.
- We will further discuss the following concepts in EERs:
 - **Subclass/superclass**
 - **Specialisation/generalisation**
 - **Constraints on specialisation/generalisation**

Subclass and Superclass

Assignment Project Exam Help

- **Subclass of an entity type:** subgrouping of entities.

- In many cases subclasses need to be **represented explicitly** because of their application significance.

<https://powcoder.com>

- Superclass/subclass, Supertype/subtype and Class/subclass are different names for the same concept.

Add WeChat powcoder

- Subclass inherits attributes and relationships of super class.
- Subclass can have additional attributes and relationships.
- This type of relationship between subclass and superclass is often described as an **ISA relationship type**.

Specialisation and Generalisation

• **Specialization** is the process of defining a set of subclasses of an entity type (top-down).

- Defined on distinguishing features of entities in the superclass, e.g., based on the *job type* of each employee:

Specialisation and Generalisation

• **Generalization** is a reverse process of specialization (bottom-up).
• Common features of entities in subclasses may be generalized into single superclass (including primary key).

Constraints on Specialisation and Generalisation

Assignment Project Exam Help

Disjointness constraint

- Specifies that the subclasses of the specialization must be **disjoint**.
- If not constrained, then entities in the subclasses may **overlap**.

Constraints on Specialisation and Generalisation

Assignment Project Exam Help

- **total** – every entity in the superclass must be a member of at least one subclass.
- **partial** – an entity may not belong to any of the subclasses.

Design Choices for the EER Model

Assignment Project Exam Help

- Specializations and generalisation can be defined to make the conceptual model accurate.
- If the subclasses has few specific attributes and no specific relationships, then
 - can be merged into the superclass,
 - replace with one or more type attributes specifying the subclasses that each entity belongs to.
- Choices of disjoint/overlapping and total/partial constraints are driven by rules in the miniworld being modeled.

Informal Method for Constructing an ER or EER Model

Assignment Project Exam Help

• Draw an ER or EER diagram to represent the following design:

- (1) Identify the entity types (including weak entity types)
- (2) Identify the relationship types (including ISA and identifying relationship types)
- (3) Identify the attributes of entity and relationship types (and their underlying domains)
- (4) Identify a primary key for each entity type
- (5) Classify each binary relationship type identified in step 2 (i.e. one-to-one, many-to-one or many-to-many)
- (6) Determine the participation constraints for each entity type in each binary relationship type
- (7) Determine the disjointness and completeness constraints for each ISA
