

Normalisation – Part 3

Assignment Project Exam Help

Summar:ypanddDiscussion

Add WeChat powcoder

Summary of Normal Forms

 1NF, 3NF and BCNF are popular in practice. Other normal forms are rarely used.

1NF: Assignment Project Fxam Help

(part of the definition for the relational data model);
https://powcoder.com
an intermediate result in the history of database design

theorx;dd WeChat powcoder

3NF: lossless and dependencies can be preserved;

BCNF: lossless but dependencies may not be preserved.

- 3NF can only minimise (not necessarily eliminate) redundancy. So a relation schema in 3NF may still have update anomalies.
- A relation schema in BCNF eliminates redundancy.

Why Denormalisation?

- Do we need to normalize relation schemas in all cases when designing a relational database?
- The normalisation process into the performance when data are frequently queried.

https://powcoder.com

- Since relation schemas are decomposed into many smaller ones after normalisation, queries decomposed into many smaller ones after return the results.
- Unfortunately, join operation is very expensive.
- When data is more frequently queried rather than being updated (e.g., data warehousing system), a weaker normal form is desired (i.e., denormalisation).

Denormalisation

- Denormalisation is a design process that
 - happens after the normalisation process,
 - is often perforing mount of the joby side was ghist ge, and
 - reduces the number of relations that need to be joined for certain queries. https://powcoder.com
- We need to distinguished WeChat powcoder
 - Unnormalised there is no systematic design.
 - **Normalised** redundancy is reduced after a systematic design (to minimise data inconsistencies).
 - Denormalised redundancy is introduced after analysing the normalised design (to improve efficiency of queries)

Trade-offs

 A good database design is to find a balance between desired properties, then normalise/denormalise relations to a desired degree.

Trade-offs – Data Redundancy vs. Query Efficiency

- Normalisation: No Data Redundancy but No Efficient Query Processing
- Data redundancies are eliminated in the following relations.

| STUDENT | | | | Course | |
|---------|-------------------------|---------------|-----------|-------------------|------|
| Name | SAUSENED I | nentæroje | ct Exam H | <u>elpourseNo</u> | Unit |
| Tom | 123456 | 25/01/1988 | | COMP2400 | 6 |
| Michael | 12345 <mark>8ttt</mark> | S:1/PHO 19850 | der.com | COMP8740 | 12 |

| Add WeChat powcoder StudentID CourseNo Semester | | | | | | | |
|--|-----------------|-----------------|--|--|--|--|--|
| StudentID | <u>CourseNo</u> | <u>Semester</u> | | | | | |
| 123456 | COMP2400 | 2010 S2 | | | | | |
| 123456 | COMP8740 | 2011 S2 | | | | | |
| 123458 | COMP2400 | 2009 S2 | | | | | |

• However, the query for "list the names of students who enrolled in a course with 6 units" requires 2 join operations.

```
SELECT Name, CourseNo FROM ENROL e, COURSE c, STUDENT s WHERE e.StudentID=s.StudentID and e.CourseNo=c.CourseNo and c.Unit=6;
```

Trade-offs – Data Redundancy vs. Query Efficiency

- Denormalisation: Data Redundancy but Efficient Query Processing
- If a student enrolled 15 courses, then the name and DoB of this student need to be stored segument by the student was a student of the studen

| https://powwoderneom | | | | | | | | |
|----------------------|------------------|------------|-----------------|----------|------|--|--|--|
| Name | StudentID | DoB | <u>CourseNo</u> | Semester | Unit | | | |
| Tom | 123 45d d | We Chase | oasimosoo | 2010 S2 | 6 | | | |
| Tom | 123456 | 25/01/1988 | COMP8740 | 2011 S2 | 12 | | | |
| Michael | 123458 | 21/04/1985 | COMP2400 | 2009 S2 | 6 | | | |

 However, the query for "list the names of students who enrolled a course with 6 units" can be processed efficiently (no join needed).

SELECT Name, CourseNo FROM ENROLMENT WHERE Unit=6;

Discussion

- Both normalisation and denormalisation are useful in database design.
 - Normalisation: obtain database schema avoiding redundancies and data inconsistencies
 - Denormalisation: pigin/pomalize brelation schemata for the sake of better query processing

- Add WeChat powcoder
 Some problems of (de-)normalisation:
 - FDs cannot handle null values.
 - To apply normalisation, FDs must be **fully specified**.
 - The algorithms for normalisation are not deterministic, leading to different decompositions.
